SMALL BUSINESS SALES ANALYSIS REPORT

Project: Small Business Sales Dashboard

Business: NovaTech Electronics (Fictional business used for this project)

Prepared by: Dilki Sandeepani

Tools Used: Microsoft Excel

Project Type: Data Analysis and Dashboard Development

Report Purpose: To summarize sales data and present key sales metrics through an Excel dashboard.

Data Period: To be confirmed from the dataset.

Report Date: 22 October 2026

1. Project Overview

The Small Business Sales Dashboard is an Excel-based data analysis project developed using fictional sales records for NovaTech Electronics.

The project organizes sales data, checks sales calculations, summarizes key metrics, and presents sales information through PivotTables and charts.

The dashboard is designed to help users review sales performance by product, category, region, and month.

Project Objectives

- Organize raw sales records in Microsoft Excel.
- Check sales calculations using quantity and unit price.
- Summarize total sales, order count, quantity sold, and average order value.
- Compare sales across products, categories, and regions.
- Present monthly sales information through a dashboard.
- Identify observations supported by the available data.

2. Dataset and Methodology

The project uses 100 fictional sales records prepared for the NovaTech Electronics analysis project.

The dataset includes the following fields:

- Order ID
- Order Date
- Product
- Category
- Quantity
- Unit Price
- Sales
- Region

A separate Clean_Data worksheet was used to review the records and check sales calculations. PivotTables were created to summarize sales by product, category, region, and month.

3. Key Sales Metrics

Metric	Reported Value
Total Sales	9,797,200
Total Orders	100
Total Quantity Sold	203
Average Order Value	97,972

Note: These values are reported from the project's Excel summary cells. The currency unit has not been specified and is therefore not assumed.

4. Sales Analysis Observations

The available PivotTable summaries show the following results:

- Top-performing product by sales: Laptop
- Top-performing category by sales: computers
- Top-performing region by sales: Kandy
- Highest-sales month: January

These observations describe the highest sales results identified in the current Excel summaries. They do not, by themselves, establish the reasons for the results or confirm future sales performance.

Business Recommendations

- Review the Laptop sales results to understand its contribution to total sales.
- Examine the computers category summary to compare its sales with other categories.
- Review regional sales summaries to understand differences between regions.
- Compare monthly sales results to identify patterns that may need further investigation.

These are suggested analysis activities, not claims that a particular business action will increase sales.

5. Dashboard Overview

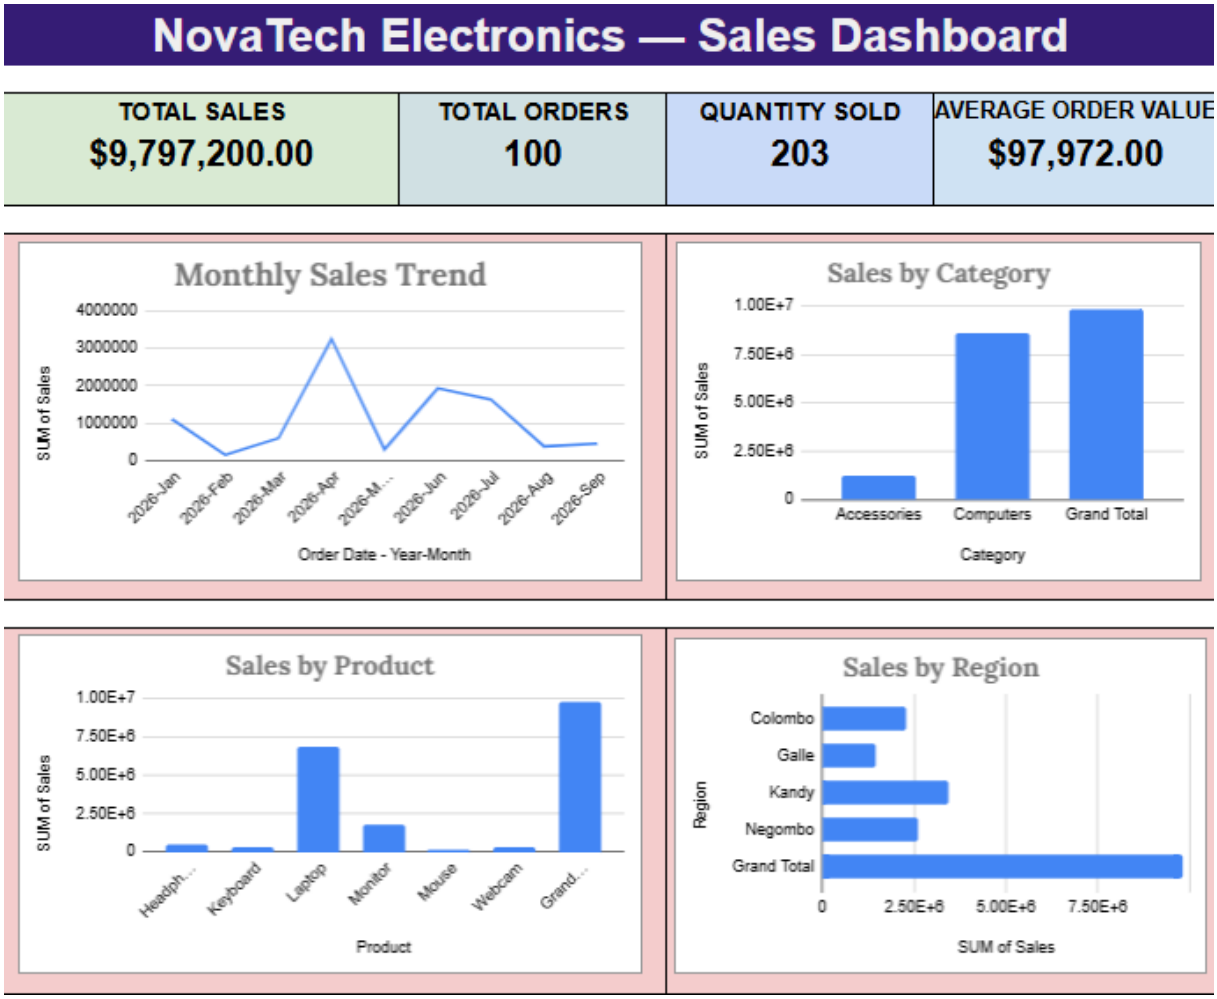

Figure 1: Excel Sales Dashboard showing key sales metrics and sales summaries by month, category, product, and region.

6. Conclusion and Limitations

This project demonstrates how Microsoft Excel can be used to organize sales records, review calculations, summarize sales information, and build a dashboard.

The current analysis identifies Laptop as the highest-sales product, computers as the highest-sales category, Kandy as the highest-sales region, and January as the highest-sales month in the provided summaries.

The dataset is fictional and is intended for portfolio and learning purposes. The results should not be interpreted as actual business performance.

The currency unit and the exact data period have not been confirmed in this report. Further investigation would be required to explain the reasons behind the observed sales results or to make evidence-based forecasts.
